

This is part of **Family API** which allow to create dual-os version of program runs under OS/2 and DOS

**Note:** This is legacy API call. It is recommended to use 32-bit equivalent

## DosSubAlloc

This call suballocates portions of a segment allocated by [DosAllocSeg](#) or [DosAllocShrSeg](#), and initialized by [DosSubSet](#).

### Syntax

```
DosSubAlloc (SegSelector, BlockOffset, Size)
```

### Parameters

- SegSelector ([SEL](#)) - input : Data segment selector that allocates the memory.
- BlockOffset ([PUSHORT](#)) - output : Address of the allocated block offset.
- Size ([USHORT](#)) - input : Memory block size requested in bytes.

### Return Code

rc ([USHORT](#)) - return

Return code descriptions are:

- 0 NO\_ERROR
- 311 ERROR\_DOSSUB\_NOMEM
- 313 ERROR\_DOSSUB\_BADSIZE

### Remarks

Before a segment allocated by [DosAllocSeg](#) or [DosAllocShrSeg](#) can be suballocated, it must first be initialized for suballocation by a call to [DosSubSet](#).

Allocation size must be a multiple of four bytes. Otherwise, it is rounded up to a multiple of four bytes. The maximum value for the size parameter is the size that was set with [DosSubSet](#) minus 8. Note that no paragraph (16-byte) alignment is required; all requests are serviced on a byte alignment basis.

A suballocated block of memory in a suballocated segment is freed by a call to [DosSubFree](#).

## Example Code

### C Binding

```
#define INCL_DOSMEMMGR

USHORT rc = DosSubAlloc(SegSelector, BlockOffset, Size);

SEL      SegSelector;    /* Segment selector */
PUSHORT  BlockOffset;    /* Block Offset (returned) */
USHORT   Size;          /* Size of requested block */

USHORT   rc;            /* return code */
```

### MASM Binding

```
EXTRN DosSubAlloc:FAR
INCL_DOSMEMMGR EQU 1

PUSH WORD SegSelector ;Segment selector
PUSH@ WORD BlockOffset ;Block Offset (returned)
PUSH WORD Size ;Size of requested block
CALL DosSubAlloc
```

Returns WORD
